

CARD SET UP GUIDES

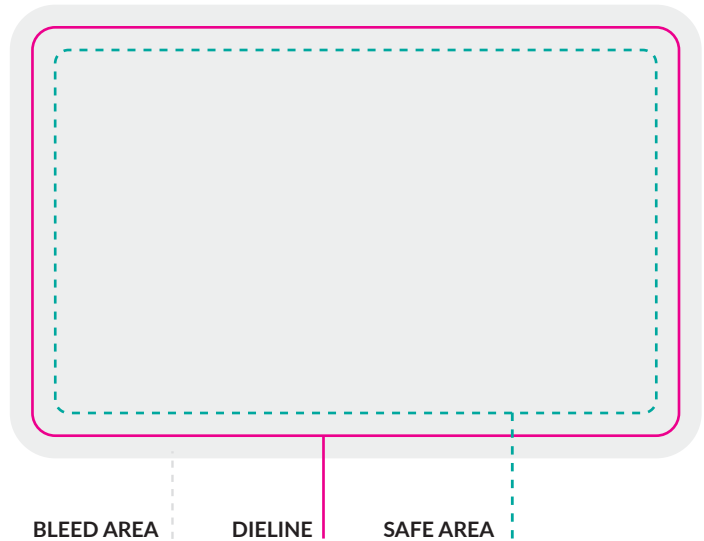

To ensure your card is printed to the highest quality we recommend you set up to the standards explained below

FILE SET UP

This template is the best guide to ensure correct print setup is achieved. PDFs are the best way to submit artwork to us and most design software will allow you to export a print ready PDF, including Canva.

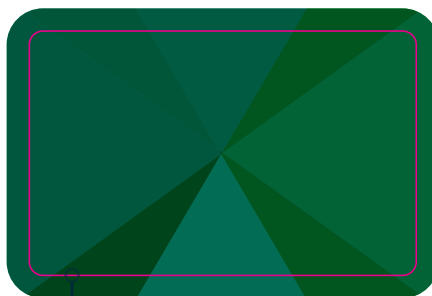

Any images within the file should always have a resolution of **300dpi**. Please ensure that the file has a 3mm bleed and crop marks (indicating lines that identify where the bleed starts and the printable area begins).

When creating the PDF, always ensure that you are converting the file to a **CMYK** colour space.

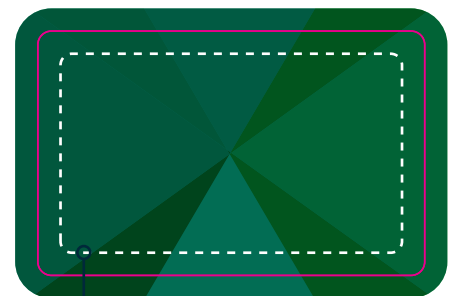

DIELINE

This line is a visual of the finished area of your card. All artwork within that area will be visible.

BLEED AREA

We require your artwork extends 3mm past the dieline.

SAFE AREA

We recommend keeping all important information within 3mm of the dieline.
